Climate Grooves

Frank Pattyn

Climate Grooves is a beat distilled from climate data through data sonification. It is the funk of Greenland and Antarctic ice sheets, polar sea ice and El Niño. Climate Grooves is a live Jazz Deep House performance with electronic instruments, such as synthesizers, groove box and Rhodes piano for improvisation.

Climate Grooves is based on data sonification, which is translating observed time series (observations of sea ice extent, mass balance of ice sheets, field measurements of melting in Antarctica, etc.) into harmonized melodies. These melodies are kept short and repeating so that they become earworms and easily identifiable. Merging them in popular music allows for these songs to reach a wider audience.
